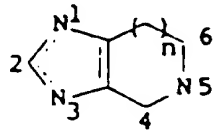
DESCRIPTION

TITLE MODIFIED
see front page

This invention relates to novel substituted derivatives of 4,5,6,7-tetrahydro-1H-imidazo[4,5-c]-pyridine-6-carboxylic acid and analogs thereof which are useful for the treatment of hypertension. US Patent 4,141,899 to Arcari et al. issued February 27, 1979, discloses 4,5,6,7-tetrahydroimidazo[4,5-c]-pyridine derivatives as antiulcer and antisecretory agents. Further examples are disclosed in Arzneim. Forsch. 34 (11) 1467-1471 (1984). These compounds differ from the ones disclosed in this invention in that they lack a substituent group at the 6-position. This variation, in combination with substitution at other positions of the imidazo[4,5-c]pyridine ring provide novel compounds now found to have anti-hypertensive activity. Japanese Patent applications J5 9095-286A to Otsuka Seiyaku Kojy, published January 6, 1984, discloses imidazo[4,5-c]pyridine 6-carboxylic acid derivatives having psycholeptic, hypotensive, central nervous system or analeptic activity.

A Belgian Patent No. 902,611 entitled "New Imidazo-Pyridine-6-Carboxamide Derivatives Useful as Antiviral Agents" discloses related compounds limited to an amide function in a C_6 position of a nuclear structure having the positions numbered as shown in the formula as follows:



Such compounds limited to the amide function are disclosed by Belgian Patent No. 902,611 as pharmaceutically active agents. Additionally related compounds having a carboxyl function at the C_6 position are disclosed by the Belgian Patent No. 902,611 but only for use as intermediates.

Thus the compounds of the first three of the above references differ from those disclosed in this invention by virtue of bearing no substituent groups at N_1, N_3, N_5, or C_4; but carrying a spiro ring at C_4. Further the present invention excludes compounds having a carboxylic acid group disclosed only as intermediates in Belgian Patent No. 902,611 discussed above. The present invention is thus pharmaceutical compositions having compounds of formula I' as defined hereinafter and a pharmaceutically acceptable carrier and method of use therefor. Such differences provide unobvious variance over the prior art.

The present invention is a novel analog of 4,5,6,7-tetrahydroimidazo[4,5-c]pyridine having the formula (I):

IIa

and the nontoxic, pharmaceutically acceptable base or acid addition salts thereof, wherein Z is oxygen or sulfur and R_{11} is branched alkyl of from three to five carbons, inclusive, and phenyl substituted with of from one through five, preferably one through three, substituents comprising lower alkyl, halo, trifluoromethyl, hydroxy, lower alkoxy, lower acyloxy, amino, N-lower monoamino, N,N-lower dialkylamino, lower thioalkyl, lower alkylsulfonyl, or nitro; together with a pharmaceutically acceptable carrier.

Also the present invention is directed to the use of a compound of formula I' for the manufacture of a medicament for treating hypertension in mammals suffering therefrom.

In the compounds of the formula I or of the formula II, the term alkyl of from one to twenty and one to fifteen carbons is meant to include a straight or branched alkyl group having the noted number of carbons, such as, for example, methyl, ethyl, propyl, butyl, pentyl, hexyl and the like and isomers thereof.

Halo includes particularly fluorine, chlorine or bromine.

Lower alkyl is methyl, ethyl, propyl, or butyl and isomers thereof.

Lower alkoxy is -O-alkyl wherein alkyl is lower alkyl.

Lower thioalkyl is -S-alkyl wherein alkyl is lower alkyl.

Lower acyloxy is alkyl —C(=O)—O- wherein alkyl is lower alkyl.

Lower alkylsulfonyl is alkyl —S(=O)(=O)- wherein alkyl is lower alkyl.

Heteroaryl is 2-, 3-, or 4-pyridyl; 1-, 2-, or 4-imidazolyl; 1-, 2-, 3-, 4-, 5-, 6- or 7-indolyl; 2-, or 3-thienyl; 2-, or 3-furyl; or 1-, 2-, or 3-pyrazolyl and the like.

The compounds of formula I are useful both in the free base form, in the form of base salts where possible, and in the form of acid addition salts. The three forms are within the scope of the invention. In practice, use of the salt form amounts to use of the base form. Appropriate pharmaceutically acceptable salts within the scope of the invention are those derived from mineral acids such as hydrochloric acid and sulfuric acid; and organic acids such as methanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, and the like, giving the hydrochloride, sulfate, methanesulfonate, benzenesulfonate, p-toluenesulfonate, and the like, respectively or those derived from bases such as suitable organic and inorganic bases. Examples of suitable inorganic bases for the formation of salts of compounds of this invention include the hydroxides, carbonates, and bicarbonates of ammonia, sodium, lithium, potassium, calcium, magnesium, aluminum, zinc, and the like.

Salts may also be formed with suitable organic bases. Bases suitable for the formation of pharmaceutically acceptable base addition salts with compounds of the present invention include organic bases which are nontoxic and strong enough to form such salts. These organic bases form a class whose limits are readily understood by those skilled in the art. Merely for purposes of illustration, the class may be said to include mono-, di-, and trialkylamines,

such as methylamine, dimethylamine, and triethylamine; mono-, di- or trihydroxyalkylamines such as mono-, di- and triethanolamine; amino acids such as arginine, and lysine; guanidine; N-methylglucosamine; N-methylglucamine; L-glutamine; N-methylpiperazine; morpholine; ethylenediamine; N-benzylphenethylamine; tris(hydroxymethyl)aminomethane; and the like. (See for example, "Pharmaceutical Salts," J. Pharm. Sci. 66 (1):1-19 (1977).)

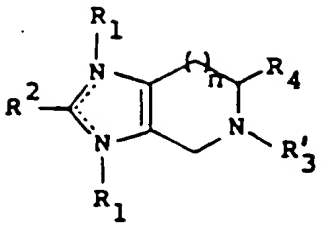
The acid addition salts of said basic compounds are prepared either by dissolving the free base of compound I, I' or II in aqueous or aqueous alcohol solution or other suitable solvents containing the appropriate acid or base and isolating the salt by evaporating the solution, or by reacting the free base of compound I, I', or II with an acid as well as reacting compound I, I' or II having an acid group thereon with a base such that the reactions are in an organic solvent, in which case the salt separates directly or can be obtained by concentration of the solution.

The compounds of the invention may contain an asymmetric carbon atom. Thus, the invention includes the individual stereoisomers, and the mixtures thereof. The individual isomers may be prepared or isolated by methods known in the art.

The novel processes of the present invention are described, generally, as follows:

Method A:

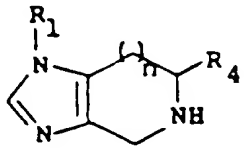
In a process for the preparation of a compound having the formula



I'

wherein R_1, n and R_4 are as defined above and R'_3 is $-\overset{O}{\overset{\|}{C}}R_5$ or $-\overset{O}{\overset{\|}{\underset{O}{\overset{\|}{S}}}}R_5$ wherein R_5 is as defined above;

a compound of formula III shown below wherein R_1, n, and R_4 are as defined above, is acylated using an appropriately activated acylating derivative of R_5CO_2H or R_5SO_3H.



III

801

Preferred methods use dicyclohexylcarbodiimide to activate the R_5CO_2H for reaction with a compound of formula III using modifications known in the art; or involve preparation of acylhalides such as $R_5\overset{O}{\overset{\|}{C}}$-Hal wherein Hal is halo, preferably chloro or bromo; or involves preparation of $R_5\overset{O}{\overset{\|}{\underset{O}{\underset{\|}{S}}}}$-Hal, wherein Hal is halo, preferably chloro or bromo, or involves preparation of mixed or symmetrical anhydrides, for reaction with a compound of formula III. The reaction is carried out in nonaqueous solvent, such as acetonitrile, tetrahydrofuran or methylene chloride, with an added organic base, such as triethylamine or pyridine, if needed at temperatures between -10°C and the reflux temperature of the solvent. Alternatively, the compound of formula III wherein R_4 is CO_2H may be acylated in aqueous basic solution with selected compounds of the formula $R\overset{O}{\overset{\|}{C}}$-Hal or $R\overset{O}{\overset{\|}{\underset{O}{\underset{\|}{S}}}}$-Hal.

For compounds of formula I' wherein R_4 defined as CO_2H is desired, compounds wherein R_4 is $COOR_9$ wherein R_9 is lower alkyl or benzyl may be hydrolyzed under mildly acidic or basic conditions using standard procedures known in the literature.

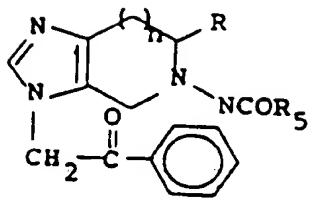
Compounds of formula III are obtained by reacting π-R_1-substituted histidine derivatives with formaldehyde or a formaldehyde equivalent such as dimethoxymethane in the presence of a strong acid such as hydrochloric acid. The reaction is carried out in aqueous medium at temperatures between 0°C and the refluxing temperature

of the solvent. Compounds III wherein R_4 is COOH are isolated and may be esterified using lower alkanols. The acid of formula III having R_4 as $COOR_9$ wherein R_9 is lower alkyl or benzyl may be reduced to form a compound wherein R_4 is CH_2OH using standard methods known in the art. π-R_1-substituted histidines are known or may be prepared by a variety of methods known in the literature, (Rec. Trav. Chim., 1972, 91, p. 246). When n is 2 then the homo histidine (Peptides Symp: Proc. 11th Eur. Peptide Symposium (1973) p. 351) is used as a starting material.

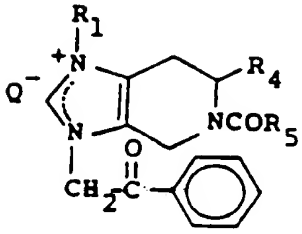
Method B:

An alternative procedure for obtaining compounds of the invention having the formula I or II wherein R_1, R_4, R_5 and n defined in a manner corresponding to IV and V below consists of treating a compound of formula IV as shown below wherein R_4, R_5, and n are as defined above, with R_1-Q, wherein Q is a leaving group suitable to be an alkylating agent, such as discussed below, and then treating the intermediate salt, a compound of the formula V, wherein R_1, R_4, R_5 and n are as defined above, with a reducing agent, preferably zinc in an acidic medium.

The compounds of formula IV or V are as follows:



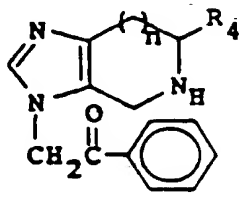
IV



V

Suitable alkylating agents are R_1-Q wherein R_1 is as defined above and Q may be halo, or sulfonate and trifluorosulfonate esters of R_1-OH wherein R_1 is as defined above. The substituent R_4 of the compound of formula I may then be processed by hydrolysis as needed. This method may also be used to prepare intermediates of formula III as shown and defined above for use in Method A. In this case, the group $R_5\overset{O}{\overset{\|}{C}}-$ is removed by hydrolysis, typically under aqueous acidic conditions within the skill of the ordinary artisan. Intermediates of the formula IV as shown and defined above are prepared by a similar sequence of reactions described for the preparation of the compounds of formula III above; namely acylation of a compound of formula VI as shown below wherein R_4 is as defined above, which is formed by an acidic formaldehyde ring formation reaction with τ-phenacyl histidine, a compound

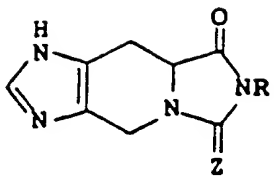
described in the literature, (J. Chem. Soc., Per I (1979) p. 2261).



VI

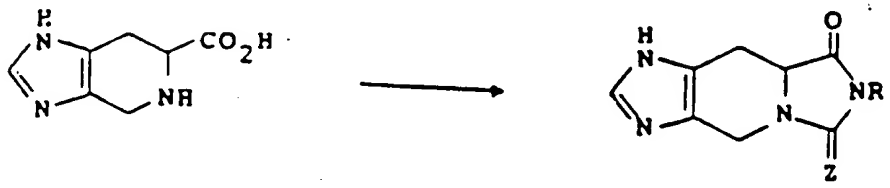
Method C:

Still another alternate procedure by which the compounds having formula I or formula II of this invention may be obtained, as well as intermediates III and IV cited above, consists of treating 4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridine-6-carboxylic acid also known as spinacine or the lower alkyl ester thereof described in (Hoppe-Seyler Zeitschrift. Physiol. Chem. (1949) vol. 284, p. 129) with an isocyanate or isothiocyanate of the formula RN=C=O or RN=C=S respectively, to give a compound of the formula (VII)



VII

wherein Z and R are as defined above. Selected compounds of formula II as described in the second part of this invention are prepared in this manner and may be shown as follows:

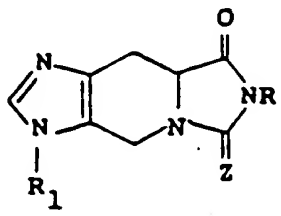


Spinacine

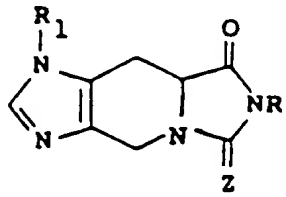
VII

Compounds of formula VII as defined above are then further converted to compounds of formula I, by treatment with an alkylating agent R_1-Q, as described in Method B, in the presence of a strong base, typically

sodium or potassium hydride or sodium alkoxide in polar aprotic solvent, such as tetrahydrofuran, dimethylformamide or the like to give a mixture of a compound of formula VIII wherein Z, R, and R_1 are as defined above and a compound of formula IX wherein Z, R_1, and R are as defined above which can be separated by crystallization or chromatography.

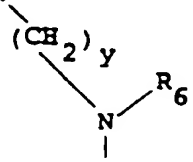


VIII



IX

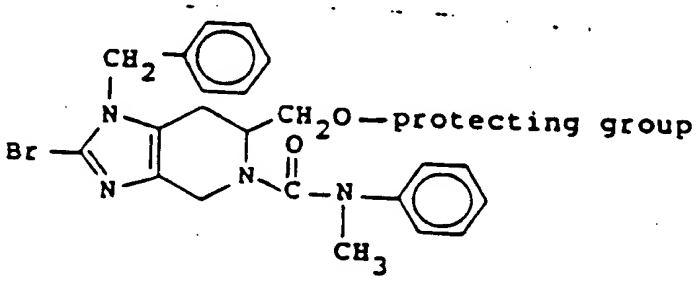
The compounds of formula VIII or IX are then in turn hydrolyzed under moderate basic conditions, e.g., alkali hydroxide in aqueous alcoholic medium at reflux until solution occurs, to give compounds of formula I wherein R_5 is R' wherein R'



and y are as defined above and R_6 is H; or under more vigorous basic conditions, e.g., concentrated alkali hydroxide treated for prolonged periods under

reflux, to give intermediates of formula III wherein R_4 is CO_2H. It should be appreciated that intermediates of formula III and VI both as shown and defined above may also be directly converted to compounds of formula VIII or IX also as shown and defined above by reaction with isocyanates or isothiocyanates.

Compounds of the formula I or II of the invention wherein R_2 is other than H may be prepared by transformations of intermediates already described. Thus, compounds of the formula I wherein R_2 is H, R_1 is as defined above, R_4 is CH_2OR_7 and R_3 is COR_5; VIII or IX both as shown and defined above, can be treated with a brominating agent such as bromine or N-bromosuccinimide in a solvent to give a compound of formula I wherein R_2 is Br or a compound of the formula II wherein R_2 is Br. Especially useful is the intermediate of the formula X as shown and defined below,



X

(the preferred protecting group is trialkylsilyl)

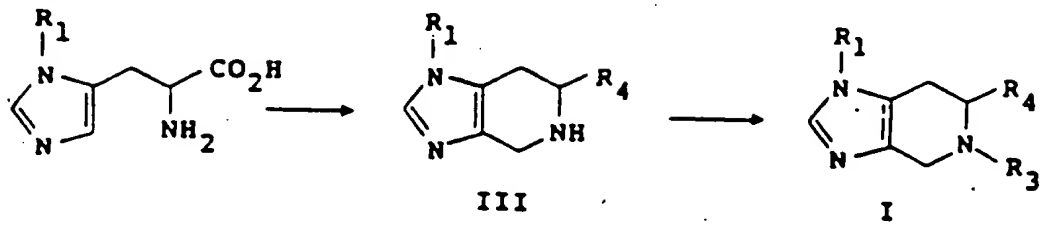
which may be further treated with an alkyllithium reagent, preferably n-butyllithium in an anhydrous

solvent at low temperature to form a lithio derivative which may react with an alkylating agent R_2-Q, where Q is as described above, an aldehyde or ketone, or an appropriate carboxylic acid derivative to install other R_2 moieties as described above. Further processing of the intermediate of formula X to compounds I defined above follows the procedures disclosed under Methods A, B, or C above.

Alternatively, compounds of formula VIII or IX both as defined above wherein Z is O, may be reacted with an aroylhalide in an aprotic solvent in the presence of a tertiary organic base such as triethylamine to give compounds of formula II where R_2 is $R'-\overset{O}{\overset{\|}{C}}-$ wherein R' is as defined above. This group may be further reduced and deoxygenated using methods known in the art to provide other R_2 substituents as defined above.

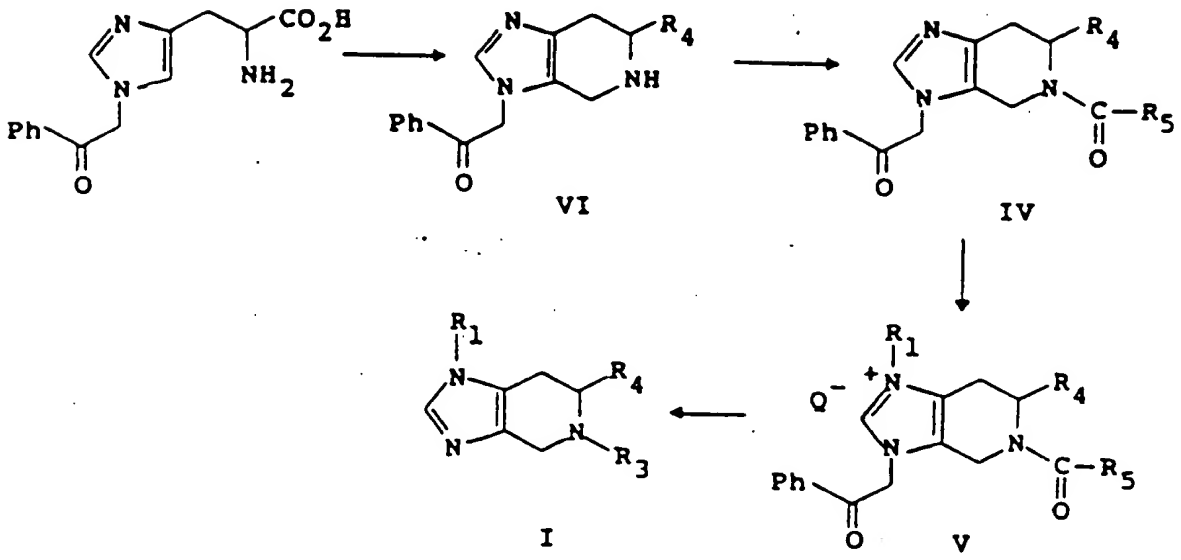
A summary of the above described general methods of preparation can be shown by the following schematic.

Method A



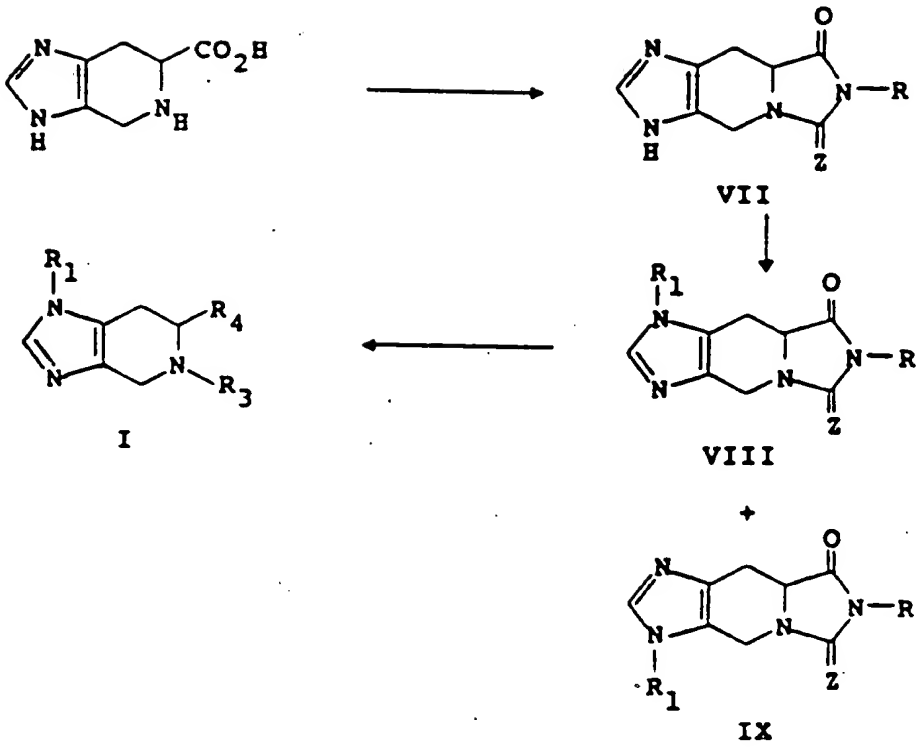
III I

Method B



VI IV V I

Method C



Under certain circumstances it is necessary to protect either the N or O of intermediates II and III in the above noted process with suitable protecting groups which are known. Introduction and removal of such suitable oxygen and nitrogen protecting groups are well-known in the art of organic chemistry; see for example, (1) "Protective Groups in Organic Chemistry," J. F. W. McOmie, ed., (New York, 1973), pp. 43ff, 95ff; (2) J. F. W. McOmie, Advances in Organic Chemistry, 3:191-281 (1963); (3) R. A. Borssonas, Advances in Organic Chemistry, 3:159-190 (1963); and (4) J. F. W. McOmie, Chem. & Ind., 603 (1979).

Examples of suitable oxygen protecting groups are benzyl, t-butyldimethylsilyl, methyl, isopropyl, ethyl, tertiary butyl, ethoxyethyl, and the like. Protection of an N-H containing moiety is necessary for some of the processes described herein for the preparation of compounds of this invention. Suitable nitrogen protecting groups are benzyl, triphenylmethyl, trialkylsilyl, trichloroethylcarbamate, trichloroethoxycarbonyl, vinyloxycarbamate, and the like.

In the process described herein for the preparation of compounds of this invention the requirements for protective groups are generally well recognized by one skilled in the art of organic chemistry, and accordingly the use of appropriate protecting groups is necessarily implied by the processes of the charts herein, although not expressly illustrated.

The products of the reactions described herein are isolated by conventional means such as extraction, distillation, chromatography, and the like. Generally,

the starting materials are known, can be purchased commercially, or synthesized by known methods.

The compounds of formula I and of formula IIa and the pharmaceutically acceptable base or acid addition salts thereof are useful as antihypertensive agents for the treatment of high blood pressure.

PHARMACOLOGICAL EVALUATION

The usefulness of the compounds of the present invention having formula I and IIa as antihypertensive agents is demonstrated by their effectiveness in standard pharmacological test procedures, for example, in inhibiting of ^{125}I-angiotensin II binding or in causing a significant decrease in mean arterial blood pressure in the conscious rat either in a 2 kidney, 1-clip Goldblatt hypertensive rat (RHR) or a spontaneously hypertensive rat (SHR).

Thus, for example, compounds of formula I when administered intraperitoneally or orally to 2 kidney, 1-clip Goldblatt (renal) hypertensive rats (See S. Sen, et al., "Role of Renin-Angiotensin System in Chronic Renal Hypertensive Rats," Hypertension 1:427-434 (1979) and Clin. Soc. 57:53-62, 1979, "Antihypertensive Effect of Prolonged Blockade of Angiotensin Formation in Benign and Malignant, one- and two-kidney Goldblatt Hypertensive Rats".) at doses in the range of 1-100 mg/kg cause 10-80 mmHg drops in blood pressure. Compounds of formula I have also been shown to antagonize the binding of angiotensin II to rat adrenal receptor preparations (procedure of J.G. Douglas et al., Endocrinology,

106, 120-124 (1980)). Compounds which antagonize the action of angiotensin II, an endogenous pressor peptide, are known to be effective antihypertensive agents (I. Reid., Arch. Int. Med., 145, 1475-1479 (1985); N. K. Hollenberg, Am. Rev. Pharmacol. Toxicol., 19, 559-582 (1979)). In addition, compounds of formula II, although not possessing this later property, have been shown to lower blood pressure in spontaneously hypertensive rats at doses of 1-100 mg/kg orally. This test has been shown to be a good predictor of antihypertensive activity in man (See K.O. Kamoto, ed., "Spontaneous Hypertension--Its Pathogenesis and Complications", Igaku Shoin Ltd., Tokyo, Springer Verlag, Berlin, Heidelbert, N.Y. and H.J. Baker et al, ed., The Laboratory Rat Vol II. "Research Applications", American College of Laboratory Animal Medicine Series, Academic Press, 1980, pp. 168-170.). Angiotensin binding inhibition activity and blood pressure lowering activity in renal hypertensive rats of the optimally substituted examples of formula I are listed in Table 1. Blood pressure lowering activity in spontaneously hypertensive rats of optimally substituted examples of formula II are listed in Table 2.

Specifically, the protocol for the test procedures resulting in the data of Tables 1 and 2 is as follows:

ANTIHYPERTENSIVE EVALUATION (AHP3)

A Method for the Direct Monitoring of Aortic Blood Pressure and Heart Rate from Conscious Rats

The continuous monitoring of pulsatile blood pressure (BP) from unrestrained conscious rats surgically equipped with polyethylene cannulas was accomplished by means of a computer assisted data capture scheme (CADCS). The basic elements of the methodology are the cannulation procedure and the CADCS.

Method

Cannulation Procedure: Rats were anesthetized with Telazol (1:1 tiletamine HCl and zolazepam HCl); 20-40 mg/kg IM and the descending aorta exposed via a midline incision. Cannulas fabricated from polyethylene tubing were inserted into the aorta via an undersized puncture hole below the renal arteries. The puncture hole was made by a 23 G disposable needle with a section of the aorta clamped off above and below the puncture site. The cannulas, consisting of a PE100 (0.86 mm ID) body and a PE50 (0.58 mm ID) tip, were attached to a trocar, inserted through the psoas muscle, and passed subcutaneously along the midline of the back and externalized between the ears. The cannulas were anchored to the psoas muscle and between the scalulae (3-0 green braided suture). The midline incision was closed in two steps (muscle first, skin second) using continuous over-and-over sutures (4-0 chronic). Each rat was then given penicillin 30,000 units subcutaneously (Penicillin G Procaine Sterile Suspension).

The rats were fitted with a harness-spring-swivel assembly designed to protect the cannula

and to provide the rat relative freedom of movement. The harnesses were fabricated from nylon hook and loop tape cemented to a metal plate to which spring wires (18-8 stainless steel), were attached to brass swivels. Each polyethylene cannula was channeled through a spring and connected through a swivel to a pressure transducer (Model P23Gb; Statham Instruments; Hato Rey, Puerto Rico) and an infusion pump (Sage model 234-7; Orion Research, Cambridge, MA) by means of PE100 tubing. While on test, each rat received a continuous slow infusion of heparinized saline solution (approximately 0.40 ml or 40 units of heparin per 24 hr period) to prevent clot formation. Additional "flushes" of the cannula with heparinized saline were carried out when the aortic pulse pressure (systolic minus diastolic) was less than 25 mm Hg.

CADCS: The pulsatile blood pressure of each of 32 rats was monitored continuously by two signal conditioning units (Gould, Clev., Ohio). The signals from these units were monitored and digital data for mean, systolic, and diastolic blood pressures as well as for heart rate were calculated every 5 min by two in-laboratory computers (Hewlett Packard, Cupertino, Ca.). These in-laboratory computers have the capacity to store 32 days of this 5 min data. Communication with the mainframe research computer (IBM 3083) from the two in-laboratory computers allowed for data analysis and report generation. The overall scheme involved modulating the primary signal from the pressure transducer, calculating the 5 min data values for

mean, systolic, and diastolic blood pressures as well as heart rate by the in-laboratory computers and generating summary data on the mainframe research computer.

In order to monitor the effects of drugs on blood pressure or heart rate, either spontaneously hypertensive rats (SHR) or renin-dependent 2 kidney, 1-clip Goldblatt hypertensive rats (RHR) were dosed intraperitoneally or orally with test compounds. Rats were dosed once daily for up to 3 consecutive days and hemodynamic variables were continuously monitored for up to 24 hr following the last day of dosing.

Accordingly, the present invention also includes a pharmaceutical composition for treating hypertension and a method for treating hypertension comprising administering to mammals, including humans, suffering therefrom either orally or parenterally the corresponding pharmaceutical composition. The composition contains a compound of the formula I' or the formula IIa each as defined above in appropriate unit dosage form.

For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets, and suppositories. A solid carrier can be one or more substances which may also act as diluents, flavoring agents, solubilizers, lubricants, suspending agents, binders or tablet disintegrating agents; it can also be encapsulating material. In powders, the carrier is a finely divided solid which is in admixture with the finely divided active compound. In the tablet the active compound is mixed with carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired. The powders and tablets preferably contain from 5 or 10 to about 70 percent of the active ingredient. Suitable solid carriers are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the

formulation of the active compound with encapsulating material as carrier providing a capsule in which the active component (with or without other carriers) is surrounded by carrier, which is thus in association with it. Similarly, cachets are included. Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration.

For preparing suppositories, a low melting wax such as a mixture of fatty acid glycerides or cocoa butter is first melted, and the active ingredient is dispersed homogeneously therein as by stirring. The molten homogeneous mixture is then poured into convenient sized molds, allowed to cool and thereby to solidify.

Liquid form preparations include solutions, suspensions, and emulsions. As an example may be mentioned water or water propylene glycol solutions for parenteral injection. Liquid preparations can also be formulated in solution in aqueous polyethylene glycol solution. Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding suitable colorants, flavors, stabilizing and thickening agents as desired. Aqueous suspensions suitable for oral use can be made by dispersing the finely divided active component in water with viscous material, i.e., natural or synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, and other well-known suspending agents.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral

administration. Such liquid forms include solutions, suspensions, and emulsions. These particular solid form preparations are most conveniently provided in unit dose form and as such are used to provide a single liquid dosage unit. Alternately, sufficient solid may be provided so that after conversion to liquid form, multiple individual liquid doses may be obtained by measuring predetermined volumes of the liquid form preparation as with a syringe, teaspoon, or other volumetric container. When multiple liquid doses are so prepared, it is preferred to maintain the unused portion of said liquid doses at low temperature (i.e., under refrigeration) in order to retard possible decomposition. The solid form preparations intended to be converted to liquid form may contain, in addition to the active material, flavorants, colorants, stabilizers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like. The liquid utilized for preparing the liquid form preparation may be water, isotonic water, ethanol, glycerine, propylene glycol, and the like as well as mixtures thereof. Naturally, the liquid utilized will be chosen with regard to the route of administration, for example, liquid preparations containing large amounts of ethanol are not suitable for parenteral use.

Preferably, the pharmaceutical preparation is in unit dosage form. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, for

example, packeted tablets, capsules, and powders in vials or ampoules. The unit dosage form can also be a capsule, cachet, or tablet itself or it can be the appropriate number of any of these in packaged form.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from 0.1 mg to 500 mg preferably to 1 to 100 mg according to the particular application and the potency of the active ingredient. The compositions can, if desired, also contain other compatible therapeutic agents.

In therapeutic use as described above, the mammalian dosage range for a 70 kg subject is from 0.1 to 150 mg/kg of body weight per day or preferably 1 to 100 mg/kg of body weight per day. The dosages, however, may be varied depending upon the requirements of the patient, the severity of the condition being treated, and the compound being employed.

Determination of the proper dosage for a particular situation is within the skill of the art. Generally, treatment is initiated with smaller dosages which are less than the optimum dose of the compound. Thereafter the dosage is increased by small increments until the optimum effect under the circumstances is reached. For convenience, the total daily dosage may be divided and administered in portions during the day if desired.

The following Examples further illustrate the invention, but without, however, limiting it thereto.

The following examples specifically illustrate generally Methods A, B and C as described above.

METHOD A

EXAMPLE 1.

Methyl-1-(2-(1-adamantyl)ethyl)-5-diphenylacetyl)-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridine-6-carboxylate.

A solution of 11.8 mL trifluoromethanesulfonic anhydride in 70 mL dichloromethane is chilled to -70°C and treated dropwise with a solution composed of 12.6 g 1-adamantyl-2-hydroxyethane, 12.2 mL diisopropylethylamine and 70 mL dichloromethane. The solution is allowed to warm to -55°C over 45 min then a solution of 25 g N,1-bis-BOC-histidine methyl ester (J. Chem. Soc., Perkin Trans. I 1982; 1553-61.) in 70 mL dichloromethane is added dropwise. The reaction is then stirred at 25°C for 24 hr and poured into pH=7, 0.25 M potassium phosphate buffer (500 mL), stirring vigorously. The organic layer is separated, washed with the same buffer, dried and concentrated. 3-(2-(1-Adamantyl)ethyl)-N-BOC-histidine methyl ester is isolated by chromatography on silica gel (chloroform-methanol, 99:1) as a gum. NMR ($CDCl_3$) 3.85 (m,2H,NCH_2).

A portion of the above product (8.4 g) is treated with 350 mL 6N HCl, heating at reflux 2.5 hr. Evaporation gives 3-(2-(1-adamantyl)ethyl)histidine dihydrochloride as a glass. NMR (D_2O) 8.85 (s,1H,2-Im); 7.55 (s,1H,5-Im).

A solution of 7.8 g 3-(2-(1-adamantyl)ethyl)-histidine·2HCl in 100 mL 1N HCl is treated with 5 mL 36% formaldehyde, stirring 30 min at 25°C followed

by 90 min at reflux. Evaporation gives 1-(2-(1-adamantyl)ethyl)-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]-pyridine-6-carboxylic acid dihydrochloride as a white solid. NMR (D_2O) 8.90 (s,1H,2-Im).

A solution of 8.0 g of the above carboxylic acid in 350 mL methanol is treated with 35 mL trimethyl orthoformate, saturated with anhydrous HCl and heated at reflux 6 hr. The resulting solution is evaporated to a foam, suspended in 350 mL dichloromethane and treated dropwise with 350 mL cold 10% Na_2CO_3. The organic layer is separated, dried and evaporated to give methyl-1-(2-(1-adamantyl)ethyl)-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]-pyridine-6-carboxylate as a gum. NMR (D_2O+DCl) 4.08 (s,3H,CO_2Me).

A mixture of 1.1 g dicyclohexycarbodiimide, 1.10 g hydroxybenzotriazole hydrate, 1.1 g diphenylacetic acid and 25 mL acetonitrile is stirred at 25°C for 10 min then treated with a solution of 2.0 g methyl-1-(2-(1-adamantyl)ethyl)-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]-pyridine-6-carboxylate in 25 mL acetonitrile. The resulting suspension is stirred 48 hr at 25°C, filtered and the filtrate is evaporated, dissolved in dichloromethane, washed with 10% Na_2CO_3, dried and evaporated. Chromatography on silica gel (chloroform) gives a yield of methyl-1-(2-adamantyl)-ethyl)-5-diphenylacetyl-4,5,6,7-tetrahydro-1H-imidazo-[4,5-c]-pyridine-6-carboxylate. NMR ($CDCl_3$) 3.63 (s,3H,CO_2Me), 5.35 (s,1H,$CHPh_2$).

After 6 hr the solution is evaporated, the residue is suspended in 10 mL water and treated with 4.1 mL 1N HCl. The resulting precipitate is collected by filtration and dried to afford a white solid, 1-(2-(1-adamantyl)ethyl)-5-diphenylacetyl-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridine-6-carboxylic acid. EXAMPLE 16.

Ethyl-1-(2-hydroxyphenyl)methyl-5-diphenyl-acetyl-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridine-6-carboxylate.

A solution of 8 g methanesulfonic anhydride in 45 mL dichloromethane is chilled to -50°C and treated dropwise with a solution of 6.2 mL 2-methoxybenzyl alcohol, 8.0 mL diisopropylethylamine and 45 mL dichloromethane. The mixture is then heated at reflux 24 hr, poured into 400 mL 0.25 M, pH=7 potassium phosphate buffer and the organic layer is separated, dried and evaporated. Chromatography on silica gel, eluting with chloroform-methanol (99:1) gives 3-(2-methoxyphenyl)methyl-N-BOC-histidine methyl ester as a gum. NMR ($CDCl_3$) 4.96 (s,2H,NCH_2Ar).

The above gum is treated with 150 mL 6N HCl at reflux for 3 hr, evaporated to a gum and triturated with ethanol to afford 3-(2-methoxyphenyl)methyl-histidine dihydrochloride as a colorless solid. MS (FAB) 267 (M+1); 551 (2M+1).

The above solid (3.7 g) is dissolved in 40 mL water and treated with 2.5 mL 36% formaldehyde, stirring 30 min at 25°C followed by 90 min at reflux. Evaporation gives a gum which is crystallized from ethanol-isopropanol to give 1-(2-methoxyphenyl)methyl-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridine-6-carboxylic acid dihydrochloride as a colorless solid. NMR (D_2O) 3.95 (s,3H,OMe).

A solution of 2.85 g of the above carboxylic acid in concentrated HBr is heated at reflux 6 hr, diluted with 100 mL water and evaporated to afford 1-(2-hydroxyphenyl)methyl-4,5,6,7-tetrahydro-1H-imidazo-[4,5-c]pyridine-6-carboxylic acid dihydrobromide as an orange colored solid. NMR (D_2O) lacks the MeO singlet described above.

The crude acid is esterified by treatment with absolute ethanol and HCl at reflux. The ethanolic solution is concentrated and added dropwise to vigorously stirred ethyl acetate. Ethyl 1-(2-hydroxyphenyl)-methyl-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridine-6-carboxylate hydrochloride hydrobromide is collected by filtration as an off-white, hygroscopic solid. NMR (D_2O) 1.33 (t,3H,CH_3).

A solution of the above ethyl ester, 3.8 mL diisopropylethylamine, 1.5 g imidazole and 60 mL acetonitrile is treated with 3.3 g t-butyldimethylsilyl chloride and stirred 7 hr at 25°C.

The reaction mixture is treated with 10 mL methanol, evaporated and partitioned between ethyl acetate and 10% Na_2CO_3. The organic layer is dried, evaporated and purified by chromatography on silica gel, eluting with chloroform-methanol (98:2) to give ethyl 1-(2-t-butyldimethylsiloxyphenyl)methyl-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridine-6-carboxylate as a gum. NMR ($CDCl_3$) 1.03 (s,9H,t-Bu).

A mixture of 1.3 g dicyclohexylcarbodiimide, 0.8 g hydroxybenzotriazole hydrate, 1.3 g diphenylacetic acid and 25 mL acetonitrile is stirred for 10 min then treated with a solution of the above

silyl ether (2.4 g) in 25 mL acetonitrile. The resulting suspension is stirred at 25°C 48 hr and filtered. The filtrate is evaporated, partitioned between dichloromethane and 10% Na_2CO_3 and the organic layer is dried and evaporated. Chromatography of the residue on silica gel, eluting with chloroform gives ethyl 1-(2-t-butyldimethylsiloxyphenyl)methyl-5-diphenylacetyl-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]-pyridine-6-carboxylate as a gum. NMR ($CDCl_3$) 5.39 (s,1H,$COCHAr_2$).

The above compound is dissolved in 50 mL acetonitrile, treated with 0.65 mL 48% HF and stirred 6 hr at 25°C. The solution is then treated with 15.6 mL 1N NaOH, diluted with ethyl acetate and washed with saturated NaCl. Organic layer is dried, evaporated and chromatographed on silica gel ($CHCl_3$) to give ethyl 1-(2-hydroxyphenyl)methyl-5-diphenylacetyl-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]-pyridine-6-carboxylate as a gum. EXAMPLE 123.
4,5,6,7-Tetrahydro-5-(2-phenylethyl)-1-(phenylmethyl)-1H-imidazo[4,5-c]pyridine-6-carboxylic acid, dihydrochloride.

Freshly dried molecular sieves (3 Å, 7.0 g) are added to a solution of 1-benzylspinacine dihydrochloride (3.4 g), 1.2 g phenylacetaldehyde and ethanol (50 mL). Triethylamine (2.0 g) is added and the mixture is stirred for 1 hr at room temperature. Bromocresol green (ca 0.10 mg) and sodium cyanoborohydride

(1.3 g) are added. Ethanolic-hydrogen chloride is then added until color became light green over the course of 1 hr. After stirring two days at room temperature, ether (50 mL) is added and excess hydrogen chloride gas is passed in. When gas evolution ceases, the sieves and solids are filtered and the intermediate ester hydrochloride is precipitated with ether (300 mL) as a gum. The free base is prepared by treating a water (20 mL) solution of the hydrochloride with excess sodium bicarbonate and extraction into ethyl acetate; wt 1.2 g.

A solution of crude ester (1.1 g), methanol (20 mL) and 1N sodium hydroxide (10 mL) is heated at reflux for 10 min and concentrated to remove the methanol. 1N Hydrochloric acid (10 mL) is added to precipitate the product as a gum. The aqueous portion is decanted and the remaining water is azeotroped by two successive additions and removed of absolute ethanol (50 mL). The remaining gum is dissolved in absolute ethanol (10 mL), filtered and treated with excess ethanolic hydrogen chloride (10 mL). Concentration gave the product which is recrystallized from ethanol-ether to give 0.10 g of the product as the dihydrochloride; mp 200-205°C.

A solution of 2.0 g of 1-benzylspinacine, 20 mL of acetonitrile, 0.8 g of 1-methylamine and 1.3 g of benzyl bromide is allowed to stand at room temperature for four days. The solvent is removed, water (10 mL)

is added and the product is extracted with ethyl acetate (10 mL) and ether (100 mL). Concentration gives the product which upon crystal-lization from ethyl acetate (8 mL) and petroleum ether gives a pure sample; mp 91-93°C.

METHOD B

EXAMPLE 135.
Methyl-5-diphenylacetyl-3-(2-oxo-2-phenylethyl)-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridine-6-carboxylate.

A suspension of 12.1 g histidine methyl ester dihydrochloride in 150 mL chloroform is treated at 0°C with excess anhydrous ammonia. The resulting suspension is filtered and the filtrate is evaporated to give histidine methyl ester as an oil. This oil is dissolved in 100 mL dichloromethane and added dropwise to a refluxing solution of 8.1 g carbonyl diimidazole in 100 mL dichloromethane. Refluxing is continued 15 min after addition is complete then the reaction mixture is concentrated until it begins to crystallize. Ethyl ether is added and the solid is collected by filtration. Recrystallization from acetonitrile gives methyl-5,6,7,8-tetrahydro-5-oxo-imidazo[1,5-c]-pyrimidine-7-carboxylate; mp 159-164°C.

A mixture of 7.8 g of the above product, 8.0 g phenacyl bromide and 200 mL acetonitrile is heated at reflux 6 hr. The cooled suspension is filtered, rinsing with acetonitrile to afford 7-methoxycarbonyl-2-(2-oxo-2-phenylethyl)-5,6,7,8-tetrahydro-5-oxo-imidazo-[1,5-c]pyrimidinium bromide; mp 223-224°C (decomposes with gas evolution).

The above imidazolium salt is treated with 250 mL 6N HCl at reflux for 4 hr and evaporated to a gum. This gum is dissolved in 500 mL ethanol, concentrated to a syrup and added dropwise to vigorously stirred ethyl acetate to give 3-(2-oxo-2-phenylethyl)-histidine as a hygroscopic mixture of hydrochloride and hydrobromide salts. MS (FAB) 274 (M+1).

A solution of 33 g 3-(2-oxo-2-phenylethyl)-histidine dihydrohalide in 400 mL 1N HCl is treated with 17.5 mL 36% formaldehyde, stirring 30 min at

25°C followed by 2 hr at reflux. Evaporation gives a gum which crystallizes upon standing. Trituration with ethanol affords 3-(2-oxo-2-phenylethyl)-4,5,6,7-tetrahydro-3H-imidazo[4,5-c]pyridine-6-carboxylic acid as a mixture of hydrochloride and hydrobromide salts. MS (FAB) 286 (M+1).

The above carboxylic acid is converted to its methyl ester by dissolution in 400 mL methanol and treatment with 50 mL trimethyl orthoformate. The resulting solution is saturated with HCl and heated at reflux 6 hr. Upon cooling, the resulting slurry is concentrated to approximately 200 mL and filtered to give methyl-3-(2-oxo-2-phenylethyl)-4,5,6,7-tetrahydro-3H-imidazo[4,5-c]pyridine-6-carboxylate dihydrochloride as a white solid. MS (FAB) 300 (M+1).

A mixture of 9.3 g dicyclohexycarbodiimide, 6.1 g hydroxybenzotriazole hydrate, 9.5 g diphenylacetic acid and 100 mL acetonitrile is stirred at 25°C for 15 min (suspension A). A mixture of 15.8 g methyl-3-(2-oxo-2-phenylethyl)-4,5,6,7-tetrahydro-3H-imidazo-[4,5-c]pyridine-6-carboxylate dihydrochloride, 14.8 mL diisopropylethylamine and 100 mL acetonitrile is stirred 10 min at 25°C then treated with suspension A, using 100 mL acetonitrile to complete the transfer. The resulting suspension is stirred 48 hr, filtered and the filtrate is evaporated, dissolved in dichloromethane, washed with 10% Na_2CO_3, dried and evaporated. Chromatography on silica gel (chloroform-methanol, 99:1) gives methyl-5-diphenylacetyl-3-(2-oxo-2-phenylethyl)-4,5,6,7-tetrahydro-1H-imidazo[4,5-c]pyridine-6-carboxylate as foam. MS (FAB) 494 (M+1).

The product is removed from the column by passage of concentrated ammonium hydroxide (200 mL) and then water (250 mL). The ammonia fractions are concentrated at reduced pressure to give 6.0 g of the amorphous amino acid. The dihydrochloride salt is prepared as follows: a solution of 6.0 g of the above amino acid in water (5 mL) is treated with concentrated hydrochloric acid (5 mL). 2-Propanol (25 mL) is added and the mixture is filtered and washed with 2-propanol (10 mL) and ether to give product. Recrystallization from water gives a pure sample, mp 280-282°C, dec.
